

Neighbourhood effects on 9-year-old children's behavioural outcomes

Amanda Quail, Carol
McGuinness & Eoin Flaherty

Outline

- **Why consider ‘neighbourhood effects’?**
- **Previous research**
- **Issues in defining ‘neighbourhood’**
- **Description of *Growing Up in Ireland (GUI)* data**
- **Preliminary results**

Why consider 'neighbourhood effects'

- **Increasing recognition that the neighbourhood within which children live can have an impact on child outcomes**
- **Bronfenbrenner 'social-ecological theory'**
- **Policy relevance – target interventions**

Some findings about 'neighbourhood effects'

- **Xue et al (2005) – children in low-SES neighbourhoods more likely to have mental health problems**
- **Grow et al (2010) - obesity most common in children living in low-SES neighbourhoods**
- **McCulloch & Joshi (2001) – neighbourhood deprivation related to lower test scores**

How 'neighbourhood' impacts on outcomes

- **Both compositional and contextual characteristics**
 - Compositional – characteristics of residents and collective social functioning (SES, Residential instability, ethnicity)
 - Contextual– material infrastructure, availability and access to resources and services

Issues in defining 'neighbourhood'

- **Boundaries**

- Meaningful boundaries

- Modifiable Areal Unit Problem

- On the edges

Description of *Growing Up in Ireland (GUI)* data

- **GUI Child Cohort Wave 1 – 8,500 nine-year-old children**
- **Linked to Small Area Population Statistics (SAPS) – compositional characteristics**
- **Parent and nine-year-old child’s perceptions of the neighbourhood in which they live – contextual characteristics**
- **Multiple measures of family SES**
- **Numerous child outcomes – health, educational, socio-emotional domains**

Compositional 'n'hood' characteristics - SAPS

- **'Neighbourhood' defined as Electoral District (ED)**
- **Neighbourhood SES**
 - % unemployed
 - % lower social class
 - % low education
- **Neighbourhood Residential Instability**
 - % not living at same address one year before Census
 - % of population not owner occupiers

Contextual characteristics - perceptions of 'n'hood'

- **'Neighbourhood' defined as 'local area' or 'around here'**
- **Parent and child perceptions of:**
 - Physical condition of the neighbourhood
 - Safety of the neighbourhood
 - Service availability
- **Involvement in community**

Outcome variable

- **Child's behaviour as measured by the Strength and Difficulties Questionnaire**
- **Parent report**
- **Externalising behaviours – conduct problems & hyperactivity/inattention**
- **Continuous score – higher score indicates more difficulties**

Descriptive analysis

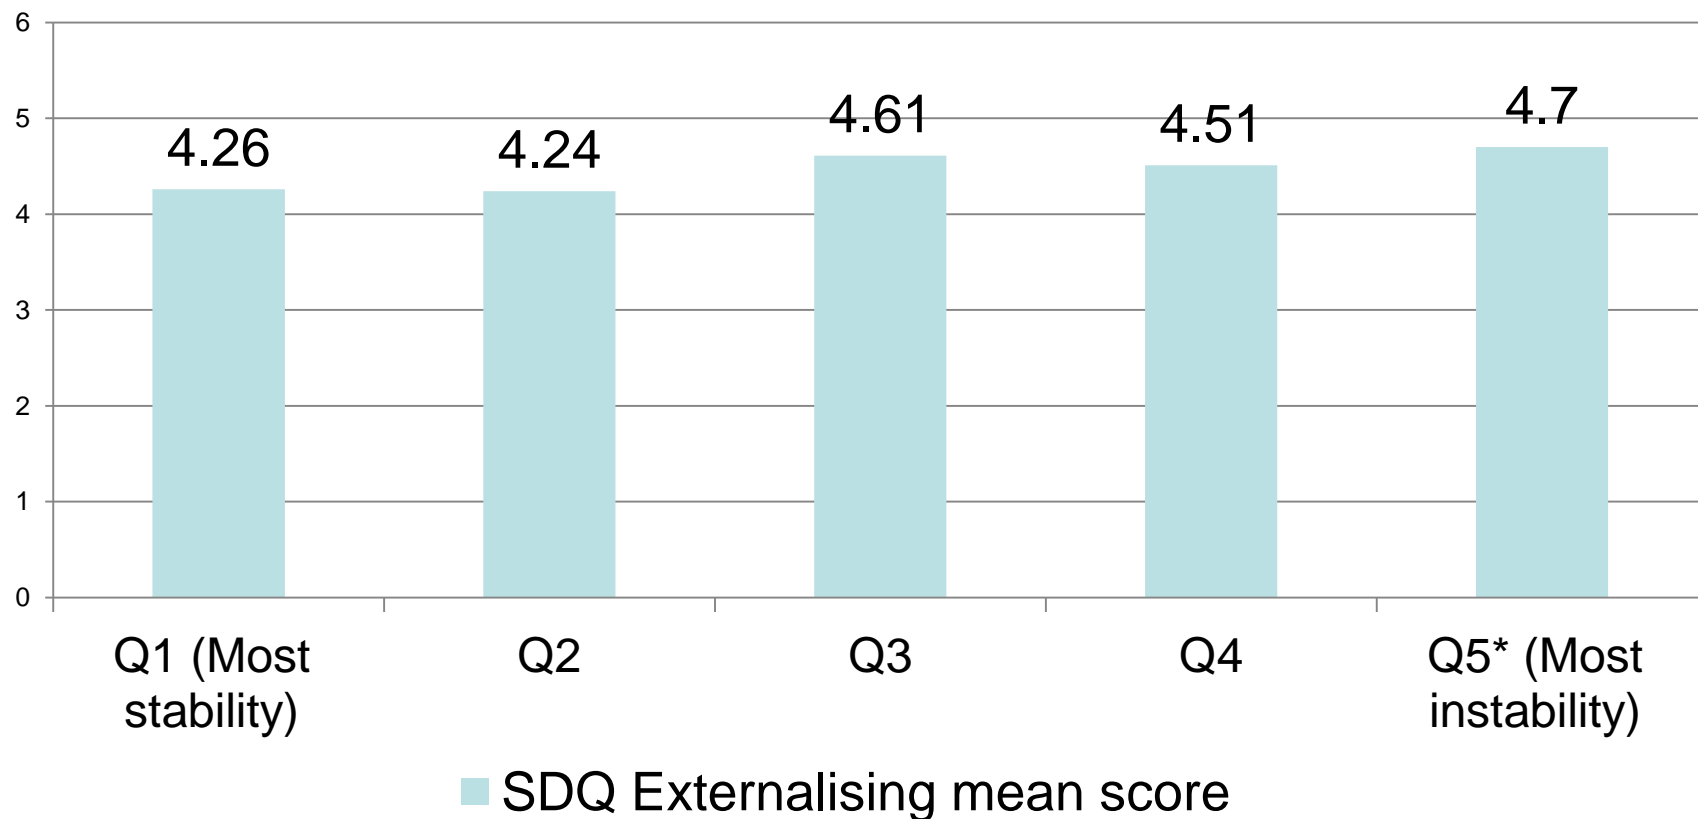

SDQ by neighbourhood SES

**Significantly different to Quintile 1 at the 0.05 level*

Descriptive analysis

SDQ by neighbourhood Residential Instability

**Significantly different to Quintile 1 at the 0.05 level*

Family, Parent and Child characteristics

- **Family:**

- Income
- One-parent family
- Family size
- Employment status
- Social class
- Housing tenure
- Household location
- Deprivation

- **Parent:**

- PCG education
- Born abroad
- PCG age
- Involuntary group
- Parenting style
- Depression

- **Child:**

- Gender
- Chronic illness
- SEN
- ALE

Multilevel Analysis Strategy

- **Two-level multilevel model**
- **Takes account of clustering within neighbourhoods**
- **Partitions the variance explained by neighbourhood and individual level effects**

Summary

- **Some variation at the neighbourhood level**
- **Initially appears to be neighbourhood SES effect**
- **Perceptions of neighbourhood are also strongly related to child behaviour**
- **Family, parent and child characteristics are stronger predictors of child behavioural outcomes and dilute the neighbourhood SES effect**
- **Possibly too young to be overly influenced by neighbourhood – still under parental control**

Thank you
